

Open Access is not about self-publishing, or online publishing without quality controls (peer review); nor is it about the scientific literature that authors expect to be paid for having published—such as books, monographs or articles in magazines.

Open Access is about the articles that are published in scientific journals, given away for free by the author to the journal publisher, and thus not expected to earn the author a penny.

With the aim of making the maximum possible contribution to research progress, authors intend these articles to be made accessible to the broadest possible readership worldwide.

Open Access increases visibility of research results, and results in increased citations and impact.

What is open access?

Open Access is very simply defined:

- It is free, immediate, permanent online access to the full text of research articles
- It permits unrestricted distribution and use of articles by anyone
- Researchers continue to be given full credit for the authorship of their articles
- Articles must be deposited in a public archive (this may be in the author's own university institutional repository, or in one of the subject-based repositories such as the US National Library of Medicine's PubMed Central)

Who benefits from Open Access?

The short answer is that we all benefit. Society as a whole benefits from an expanded and accelerated research cycle and scientists can work more efficiently because they have access to all the findings they need:

- **Scientists-as-authors:** Open Access increases the visibility of their work and results in more people citing the work and in turn building upon it. In other words, Open Access increases the impact of a scientist's findings.
- **Scientists-as-teachers:** Open Access means that there are no restrictions on providing articles for teaching purposes; under closed-access conditions this is severely restricted by copyright regulations and sometimes scientists cannot even satisfactorily make copies of their own articles for the purpose of teaching their own students.
- **Scientists-as-readers:** Open Access means that it is easy to find and access articles of interest that a scientist needs for his/her research.
- **Universities:** Open Access means that universities also benefit from their researchers' increased visibility and impact.
- **Research funders:** Funders such as governments and charities get the best possible impact for their investment.
- **Publishers:** Publishers benefit from the wider dissemination and greater visibility of their articles and the increased impact this brings.
